Client question: When having a problematic student, should you be notified for the whole group and then the problematic students in the group, or just have the problematic students? The flag should be on the student -> yellow traffic light for entire group since it needs attention from lecturers

Client question: Maybe there is a project from the faculty in PHP laravel that we could take a look at. Repository.
Laravel pipeline already exists, we can copy it
Invoiceninja, open source that uses laravel https://github.com/invoiceninja/invoiceninja
Laracasts, video tutorials from scratch on how to use laravel 8
https://laracasts.com/

Client question: order of weeks and groups, which comes first?
as lecturer -> groups then weeks
as TA -> weeks then groups (oof?) Add groups (higher in priority list) first and if we see the option to add a switcheroo button for them we can implement it

Client question: Who uploads the students and assigns groups? Can TA upload his/her own groups?
Teachers and head Tas(help with grouping)
TAs don't have to create their own groups in the system

technical comment: useful to register who grades the rubric
to save space: leave courses out of the side bar, have course selection on a front page
problem cases as a list(name,description,severity) instead of big boxes next to each other if we run out of space

Client question: How interesting do you think these requirements we've gotten from the form are.
Small additions:
add threads for interventions (multiple follow ups)
dummy login, netid takes months
ability to upload reports from buddycheck is a could have
hierarchy: course->course edition->etc
interventions can go one level up (can span multiple weeks)
interventions should be seen by the tas of the particular group
could have: mark it as private also the ta cannot see it
first should have (also should be a must have) is too similar to first must have
search for students(student number, email, name), filter the groups by number, searching by ta
open fields in rubrics to allow for notes on each section (could/should have)
traffic light thing i like :)
deactivation of problem cases -> could have
From brightspace: plain csv -> export doesn't give the link of TAs to groups/ hard to integrate
Use both student number and netid into our system (useful for osiris export)
For TAs -> students numbers should be hidden (considered private data)
